

## UX Researcher job description

A UX Researcher is a professional who systematically studies target users to collect and analyze data that will help inform the product design process.

### UX Researcher responsibilities include:

Meeting clients to gather information about their requirements and to find out what needs researching, designing, or usability testing

Getting involved in sketching, prototyping, and user testing before passing the design onto the development team

Applying qualitative research methods to client projects based on their needs and goals.

### Job brief

We are looking for a UX Researcher to join our team and implement various UX designs into our programs and computer systems based on the need of users to ensure customers have an enjoyable experience when using our products.

UX Researcher responsibilities include conducting user research and working with the design team to implement design choices to improve user experience.

Ultimately, you will work with Designers and Programmers to ensure our products and computer systems are easy to use and help us achieve our organizational goals.

### Responsibilities

Have an awareness of costs and budgets

Put users at the center of a design to make it simple, easy to use, and good looking

Present the stages of the design development to business users

Work closely within a multidisciplinary team, including web developers and programmers

Provide technical instructions to programmers

Ensure websites comply with the law and equal opportunities policies.

### Requirements and skills

Proven work experience as a UX Researcher or similar role

Experience implementing design choices based on user feedback

Experience working with Designers and Programmers to improve the usability of products and other features

Relevant training and/or certifications as a UX Researcher
